

Data Center PDU

Integrated distribution, transformation and monitoring

Coordinate data center power distribution with transformer, protection and monitoring functions in an integrated enclosure. Specify the PDU around your IT load, voltage requirements and facility monitoring system.

Configuration options

- Dry-type transformer section
- HMI display for metering, alarms and diagnostics
- Main breaker and branch-circuit distribution
- Surge protection and branch-circuit monitoring
- Ventilated enclosure with service access
- BMS and SCADA monitoring integration

Define your requirements

- Required kVA and future load growth
- Input voltage: 415, 480 or 600 V requirements
- Output: 120/208, 230/400 or 240/415 V requirements
- Transformer winding material and K-factor
- Breaker ratings, access and enclosure dimensions

Product illustration

Power ratings, voltage options, transformer characteristics and certification requirements are confirmed by Atlas for each project.
